CLAIMS

A pneumatic tire comprising
 a tread portion having tread edges.

the tread portion provided with shoulder blocks in a row along each said tread edge,

said shoulder blocks in a row divided by a circumferential groove and first shoulder grooves and second shoulder grooves, said first shoulder grooves and second shoulder grooves alternating in the tire circumferential direction and each extending from the circumferential groove to the tread edge, wherein

a circumferential width (WLo) of the first shoulder groove at the tread edge is larger than a circumferential width (WSo) of the second shoulder groove at the tread edge,

the ratio (WLo/WSo) of said circumferential width (WLo) to said circumferential width (WSo) is larger than a ratio (WLi/WSi) of a circumferential width (WLi) of the first shoulder groove to a circumferential width (WSi) of the second shoulder groove, each measured at the circumferential groove.

- 2. A pneumatic tire according to claim 1, wherein the groove width WLo is larger than the groove width WLi, and the groove width WSo is larger than the groove width WSi.
- 3. A pneumatic tire according to claim 1, wherein the ratio (WLo/WSo) is in a range of from 1.10 to 1.80 and the ratio (WLi/WSi) is in a range of from 0.90 to 1.10.
- 4. A pneumatic tire according to claim 1, wherein

each said shoulder groove is bent in a middle part thereof so as to have a crank shape.
